

We need to get wires **from the tower** to these 3 locations
It can be underground or overhead

Suggestion: If you do not have an unground pipe at the starting line, then you should consider locating one just behind the concrete of the burnout area. Make a cut across the track and lay a 4 inch diameter pipe with a tee (upspout) in the middle of the track. Make sure the pipe about 12 inches under ground and sticks out from the edges of the track at least 1 to 2 feet.

Finish Line: It is best to have a cross over tube at the finish line under the race track surface. This can be done with a 2 inch diameter pipe and can be done the same way as the start line.

After you get the pipe located, you can cement over the top of the track surface to smooth it out !
